

Although demand for the products of the Precision Instrument Industry seems to be moderating, we still look for 2011 to be a decent year for the group as a whole. The industry's Timeliness rank is currently in the middle of the 98 industries under Value Line review. Yet, its prospects 3 to 5 years hence still appear bright.

Prospects For This Year And Next

Industry shipments during the three months ended June 30th were up 6.7%, compared to a 21% increase in the year-ago period, which indicates that many of the companies in this industry are rebounding from the recent economic turmoil, yet have moderated their spending somewhat over the last three months. Seemingly, many of the end users of the products and services offered by the companies that comprise this industry continue to spend, yet at a somewhat more cautious pace. And demand in certain foreign countries is bouncing back more rapidly than in the United States, which augurs well for those companies contained in this sector that generate more than 50% of their total revenue from outside the U.S.

The Coming 3 to 5 Years

Over the long haul, we expect further growth, reflecting the worldwide need for testing and measurement devices that manufacturers use in conjunction with new product development, cost cutting, quality control, and other areas needed to maintain or improve competitiveness. However, it is important to note that due to the capital goods nature of this industry's offerings, earnings are likely to continue to be volatile.

Nonetheless, based on our earnings projections through 2014-2016, a number of these issues offer attractive appreciation potential over the long haul. Cautious investors beware, though, as many of these issues display more risk than usual, and are therefore best suited for risk-tolerant investors.

Certainly A Diverse Group

Many of the companies here, such as *Eastman Kodak*, derive the bulk of their sales from consumer products. Others, including *KLA-Tencor* and *MTS Systems*, are primarily involved in providing capital goods and/or services to other manufacturers. The economic factors that affect these two main divisions are diverse too.

INDUSTRY TIMELINESS: 50 (of 98)

Shipments - Measuring & Controlling Devices (\$Billions)

Consumers

The health of the job market is the main determinant of consumer spending. Unemployment is still at levels not seen since the early 1980s. However, consumer spending, which accounts for 70% of economic activity, should strengthen from current low levels.

Industry

Stronger demand, coupled with recent production cuts aimed at decreasing manufacturing costs, has probably created the need for new capacity, a positive for most companies in this industry. As previously discussed, competitive pressures are sure to persist regardless of capacity needs, and should be a source of industrial sales growth.

Conclusion

The Precision Instrument Industry ought to post solid sales and earnings increases in 2011. Demand is still relatively strong, and we look for more of the same as the U.S. and global economies hopefully emerge from their recent difficulties.
